+ Arduino Smart Control is a simple, intuitive and powerful Arduino development tool that provides a simple way to communicate, or more appropriately to manage, your Arduino Nano via the serial. This set of features makes it a powerful and versatile tool that can be used in a variety of projects, including school projects that involve electronics, robotics and embedded systems. Arduino Smart Control Features: + The program can be used to switch between Monostable and Bistable modes + You can save readings in the memory so that you can compare them with other readings you take in the near future + For example, you can record the temperature in the 0 to 100°C range + It is also possible to measure humidity and light + Other functions include the ability to run the board in monostable, bistable or relay mode + You can set the On-Timer time to change the mode between On/Off + There is the ability to change the I/O pin used + In addition, the code contains comprehensive help on the program + The last thing to mention is that it is highly compatible with Arduino Nano A set of simple, but powerful, features make Arduino Smart Control a versatile tool that you can use in a variety of projects, including school projects that involve electronics, robotics and embedded systems. If you are using an Arduino Nano, you will be delighted to know that the program can be used to measure the temperature, humidity and light as well as switch the board between on/off and monostable/bistable mode. To use the tool, start by installing the Arduino IDE, which is available for free on the official website. After you have done this, download the program from this link. It is advisable to save the file to your computer, preferably in the main folder where you have installed the Arduino IDE. As a last step, open the Arduino IDE and, once you have selected Tools > Board, choose Arduino Nano and click OK to set it as your board of choice. After these things, you will have to open Arduino Smart Control, which will open a menu to start the program. In the next step, choose "Programming Mode" and "Save Settings", then click the "Arduino Nano" icon and select the file you have saved. After this

Creates a custom keyboard macro for your Arduino Nano. Once you have uploaded the macro it will take place automatically whenever you press the keyboard's CAPS LOCK key. You can define new macros or edit the ones you already have in the menu. Keyboard macros are automatically generated from the source code (available in a separate folder), based on the devices you configured in the settings. Keyboard macros can be activated on-the-fly by pressing the CAPS LOCK key while a user-defined key is held down. Keyboard macros can be used on the Nano with a compatible keyboard, such as the Arduino Keyboard shield. KEYMACRO Features: • Manual and automatic generation of keyboard macros. • Automatic macro generation from source code. • Supports both ANSI and ISO keyboards. • Supports macro definition and editing for existing macros. • Preserves the key state before the macro is entered. • Overwrites the current macro if it already exists. • Preserves the original state of the keys between macros. • Preserves the key state between macros and tests, allowing "Send", "End", "Key down", and "Key up" sequences to be executed. • Additional keyboard macro support. • Preserves the menu states between keyboard macros. • Supports "Send", "End", "Key down", "Key up", "Press", "Hold", "Release", "Error", and "Test" buttons. • Uses the Nano's Mega SPI library. • Uses the standard Arduino IDE serial library. • Supports a working rate of up to 2 kHz. Keyboard Macro Commands: • Send: Executes a function or runs a program. • End: Ends the current macro. • Key down: Presses the key. • Key up: Releases the key. • Press: Puts the "Press" button in "Hold" state. • Hold: Puts the "Press" button in "Press" state. • Release: Puts the "Press" button in "Released" state. • Error: Puts the "Press" button in "Error" state. • Test: Puts the 77a5ca646e

An Arduino Nano is a relatively compact microcontroller platform for the usage in embedded systems and robotics applications. Due to its small size and low power consumption, Arduino Nano is ideal for IoT projects in which the board is embedded in various mobile and stationary devices and appliances, which are powered by limited battery or are wired to the power supply. The cost-effective Arduino Nano is based on the widely-used Arduino Uno board and has the same interfaces. It is equipped with several analog and digital pins. The analog pins are the ADC (Analog to Digital Converter) pins 0 to 5, which can be used for sensor measurements. The digital pins are the I/O pins, namely pin 0 to 13, which are used for interfacing to the various microcontrollers. The Arduino Nano is compatible with the Arduino IDE and therefore the Arduino platform is developed and programmed in a similar way. However, the Arduino Nano is different from the Arduino Uno in that it has a USB interface which can be connected to a computer, as well as a serial interface. In the Arduino environment, your Nano is the "brain" of the system. Your Nano can be programmed to turn on/off an LED, or can control an Arduino Leonardo, Arduino UNO or Mega. It can read sensors, drive motors, play audio or run a robot in a "brain". Arduino Smart Control Features: ✔ Uses the Arduino IDE (included) ✔ Allows you to set the bistable pin (using the PWM) to 1 second and the relay to open/close ✔ User configurable start pin selection ✔ Configurable LED pin selection ✔ Supports the temperature, humidity, power/usb port and sound sensor ✔ Configurable relay pin selection ✔ User configurable LED polarity ✔ User configurable LED blink period ✔ User configurable blink mode ✔ Serial port for the Arduino Nano is supported ✔ User configurable input pin selection ✔ User configurable output pin selection ✔ User configurable measurement ✔ User configurable unit ✔ User configurable device name ✔ User configurable firmware path ✔ User configurable version ✔ Supports all microcontrollers based on ATMEGA2560 Make a DIY Router Hacking Board and learn how to make your own HackRF and HackRF2. This is HackRF Tutorial and for HackRF Tutorial Please go to http

Arduino Smart Control is a simple yet flexible application for your Arduino Nano. It allows you to manage all the components of your Nano. It will show you the name, serial number, status and the temperature of each LED along with the humidity and light. It has also a basic button to wake up and reset your Nano, plus a button to activate/deactivate the Relay. Arduino Smart Control Features: Manage LEDs with Monostable and Bistable functions. Measuring the temperature, humidity and light using the built-in Sensor. Activate the relay using the button. In the case of the light sensor, you can set it to activate between 3 and 15 minutes, or between 10 and 40 minutes, or you can set it to activate after a fixed period of time. Update Date: 08/03/2018 10:40 AM Arduino Smart Control is a simple yet flexible application for your Arduino Nano. It allows you to manage all the components of your Nano. It will show you the name, serial number, status and the temperature of each LED along with the humidity and light. It has also a basic button to wake up and reset your Nano, plus a button to activate/deactivate the Relay. Arduino Smart Control Comments: Arduino Smart Control is a simple yet flexible application for your Arduino Nano. It allows you to manage all the components of your Nano.
